

Personal Statement

I am a cybersecurity enthusiast with hands-on experience building and documenting security focused web applications and web forensics lab to simulate attacks and identify indicators of compromise. I am skilled in Linux environment, analyzing threat domains and practice identifying security focused insights. I am passionate about threat detection, secure coding, and growing into an Information Security Professional.

Work Experience

- **Networking Intern at Fiberone Broadband, Port Harcourt, Nigeria.**

07/2024 - 12/2024

Fiberone Broadband specializes in internet provision services and I gained hands-on experience in installing a network via stringing fiber optic cables, mounting a network terminal, connecting it to a router and ensuring the connection is stable.

- **Technical Research Intern at Cyberdeflex, Abuja, Nigeria.**

12/2025 - Present

As a technical research intern at Cyberdeflex, I map out the fundamental architecture of a technology of threat vector, understanding the underlying mechanics. I structure it into how it works, the business and technical impact and actionable mitigation strategies.

In my threat research, I investigated and drafted reports on major localized breaches, specifically analyzing the BPE/NullSec Nigeria incident, the CIBN dark web forum database listing and the NNPC HMO/XP95 data exposure. My methodology involved treat intelligence triangulation: mapping out the attacker profiles such as analyzing the listing details provided by the threat actors, assessing the volume of exfiltrated data and verifying the specific data schemas leaked like patient identifiers or corporate financial data.

Personal Projects

- **Web-app-owasp-top10**

I built a web application demonstrating common OWASP Top 10 vulnerabilities and their secure implementations, implemented input validation and authentication security controls, analyzed insecure and secured code to understand attack vectors and mitigation techniques and documented findings and security improvements using GitHub.

- **Webapp-forensics-lab**

I designed a vulnerable web application for attack simulation and forensic analysis practice, simulated security incidents to understand investigation workflow, practiced identifying indicators of compromise in web environments and strengthened understanding of incident response fundamentals.

- **Webapp-pentest-methodology**

This project demonstrates a structured methodology for conducting authorized web application penetration testing using an OWASP Juice Shop lab environment. It combines hands-on security testing techniques including reconnaissance, JWT analysis, authorization (IDOR) assessment, and TTP security header evaluation with custom Python tools for security header scanning, directory enumeration and input reflection checking.

- **Dvwa-security-assessment**

This project demonstrates both offensive security techniques and defensive security controls, highlighting the importance of secure configuration, encryption, and forensic analysis in protecting modern web applications: network reconnaissance and vulnerability mapping using Nmap, discovery and testing of web vulnerabilities such as SQL injection and XSS, controlled exploitation using Metasploit, digital forensic analysis of server logs to identify attack traces, implementation of HTTPS encryption and TLS analysis with Wireshark, server hardening through service reduction, patching and security configuration, post-hardening security reassessment to measure improvements.

- I participated in a CTF (Capture the Flag Challenge) where I carried out vulnerabilities in web applications, such as SQL injection, Cross-Site Scripting (XSS), or authentication bypass, to retrieve hidden information

- I published an e-book "Remote Workers Digital Survival Guide" on Selar to address the expanding attack surface caused by distributed workforces. When employees move outside a hardened corporate firewall, they become prime targets for social engineering and man-in-the middle attacks.

Education

- Bachelor's degree in Computer Science

University of Port Harcourt, Rivers State.

09/2021 - 09/2025

Certifications

- Professional Foundation issued by ALX Africa
- Virtual privacy academy (Nigeria Data Protection Commission (NDPC))
- Jobberman Soft-Skills Training
- Cyber Security Course at Axia Africa
- Ongoing Web Application and Digital Forensics course at ICDFA
