

WALIYAT OLALEKAN

No 8 MTN Road, Port Harcourt | (+234)8148473125 | walzlekan@gmail.com | <https://github.com/waliyatolalekan>

PERSONAL STATEMENT

A cybersecurity enthusiast with practical experience in building and documenting security-focused web applications and web forensics labs to simulate attacks and detect indicators of compromise. Proficient in Linux, threat domain analysis, and security insight generation, with a strong interest in threat detection, secure coding, and advancing toward a career as an Information Security Professional.

SKILLS

- Vulnerability Assessment and Security: Web App Security (OWASP Top 10) | Penetration Testing | Hardening & Server Patching | Network Reconnaissance.
- Threat Intel and Research: Threat Triangulation | Threat Profile Mapping | Security Incident Reporting.
- Tools and Technologies: Nmap | Metasploit | Python | Linux | Git | GitHub | DVWA | OWASP Juice Shop.

WORK EXPERIENCE

- Technical Research Intern at Cyberdeflex, Abuja, Nigeria. (12/2025 - Present)

As a technical research intern at Cyberdeflex, I map out the fundamental architecture of a technology of threat vector, understanding the underlying mechanics. I structure it into how it works, the business and technical impact and actionable mitigation strategies.

PERSONAL PROJECTS

- Web-app-owasp-top10 - I built a web application demonstrating common OWASP Top 10 vulnerabilities and their secure implementations, implemented input validation and authentication security controls, analyzed insecure and secured code to understand attack vectors and mitigation techniques and documented findings and security improvements using GitHub.
- Webapp-forensics-lab - I designed a vulnerable web application for attack simulation and forensic analysis practice, simulated security incidents to understand investigation workflow, practiced identifying indicators of compromise in web environments and strengthened understanding of incident response fundamentals.
- Webapp-pentest-methodology- A structured methodology for conducting authorized web application penetration testing using an OWASP Juice Shop lab environment. It combines hands-on security testing techniques including reconnaissance, JWT analysis, authorization (IDOR) assessment, and TTP security header evaluation with custom Python tools for security header scanning, directory enumeration and input reflection checking.
- Dvwa-security-assessment - Conducted an end-to-end security assessment of a web application combining offensive techniques (Nmap reconnaissance, SQLi/XSS testing, Metasploit exploitation) with defensive controls (log-based forensic analysis, HTTPS/TLS implementation, server hardening).
- I participated in a CTF (Capture the Flag Challenge) where I carried out vulnerabilities in web applications, such as SQL injection, Cross-Site Scripting (XSS), or authentication bypass, to retrieve hidden information
- I published an e-book "Remote Workers Digital Survival Guide" on Selar to address the expanding attack surface caused by distributed workforces. When employees move outside a hardened corporate firewall, they become prime targets for social engineering and man-in-the middle attacks.

EDUCATION

Bachelor's degree in Computer Science | University of Port Harcourt, Rivers State | 2021-2025

CERTIFICATIONS

- Professional Foundation issued by ALX Africa
- Virtual privacy academy (Nigeria Data Protection Commission (NDPC))
- Cyber Security Course at Axia Africa
- Ongoing Web Application and Digital Forensics course at IC DFA
